

Project Design Phase

Solution Architecture

Date	9 September 2026
Student Name	Burada Laxmi Sai Priyanka
Project Name	Licensed Software Installation Request through Service Catalog
Maximum Marks	

Solution Architecture

The architecture connects the Service Portal, Licensed Software Request Catalog, validation rules, license availability checks, approval process, and software fulfillment tasks to manage employee software installation requests efficiently.

Solution Architecture — Licensed Software Request Management

Employee → Service Portal → Software Catalog Item → Validation → License Check → Approval → Installation Task

Request status is updated throughout the fulfillment lifecycle.

Figure 1: Solution architecture for the Licensed Software Installation Request project.

Layer	Components	Responsibility
Experience	Service Portal, Software Request Catalog	Employee request interface for accessing and submitting licensed software requests.
Interaction	Catalog Client Scripts, UI Policies, Catalog Actions	Controls form behavior, validates inputs, and shows or hides fields dynamically.
Catalog	Licensed Software Catalog Item	Collects software name, version, business justification, device, and installation details.
Rules	Catalog UI Policies, Client Scripts, License Validation	Validates request data, controls dependent choices, and checks license availability.
Automation	Flow Designer, Approvals, Notifications	Routes approvals, creates fulfillment tasks, sends notifications, and updates request status.
Data	REQ, RITM, Software Request, Fulfillment Task	Stores employee requests, requested items, license checks, approvals, and installation records.
References	sys_user, sys_user_group, Software/License records	Provides employee, approver, fulfillment group, and licensed software reference data.
